Abstract of **JP 56065630 (A)**

PURPOSE:To facilitate handling and to increase the capacity of water absorption by a method wherein a water-insoluble, water-absorbing resin is mixed with aggregated fibers, and the mixture is structured into tufty blocks having a specific apparent- specific-gravity, with each block having a specific weight.

CONSTITUTION:An absorbing material consists of a mixture of a uniformly dispersed, water-insoluble water-absorbing resin 2 and aggregated fibers 1 (which may be natural, semisynthetic, or synthetic fibers), in which the mixture is divided into tufty blocks, each having a weight of 0.5g or less (preferably 0.001-0.5g) and having an apparent specific gravity of 0.1g/cm³ or more. Such an absorbing material has a weight ratio of the water-absorbing resin 2 to the aggregated fibers 1 being from 100:1-100:10,000, and appears as tufty blocks.; This absorbing material is easy to handle, has a high water-absorbing capacity, and thus is suited to hygienic napkins and paper diapers.
